

Digitalization made easier than ever with no-code workflows!

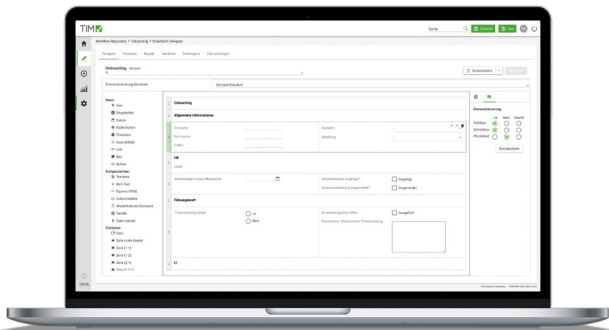

Radically easy: Our unique human workflow software is now available with no-code workflows. With our intuitive TIM Smartform Designer (TSD), you can digitalize your processes yourself in the blink of an eye! Intuitively create a form for your entire process using drag and drop without having to write a single line of code yourself. The perfect tool for the TIM BPM Suite, the new TSD is raising the bar with cool features such as:

#1 Form configurator for greater efficiency

With the web-based configurator, you can easily create tailored, in-process forms yourself. The intuitive Smartform Designer continues to work for you following a “What you see is what you get” (WYSIWYG) principle, ensuring you have an overview of the final design even as you make changes. Simply drag and drop established form elements to configure your forms and then integrate them into your process!

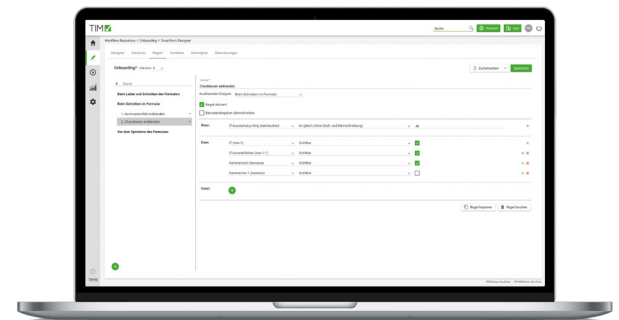

#2 Element control for greater structure

The integrated element control gives you the option to dynamically adjust your form for every step of the process with custom display options and write permissions. As a result, everyone involved in a process receives targeted information about their specific tasks based on where they are in the process. Improve information quality even further with required fields, while preventing time-consuming questions about the process from arising. With TIM, you can effortlessly ensure smooth information logistics!

#3 Rule configurator for greater dynamics

Thanks to the no-code configuration of TIM 7, creating and testing rules has never been so easy! Use our intuitive rule configurator to create dynamic form content and increase the efficiency of your forms by adding as many rules as you need, following an IF THEN approach. Complex logics can be implemented in just a few clicks without the need for IT know-how (no scripting), and comprehensive forms can be displayed.

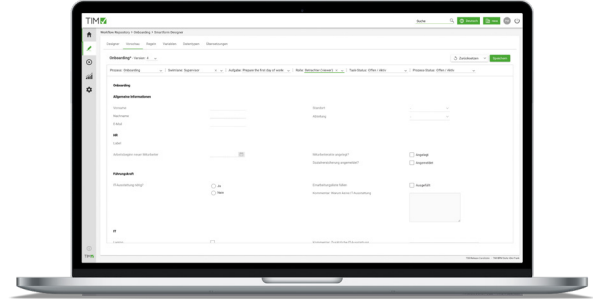

TIM 7

No-code workflows at last!

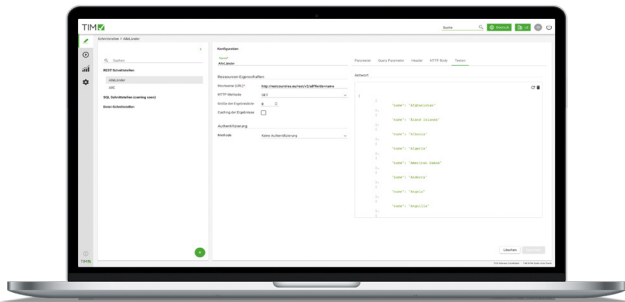

#4 Preview mode for greater clarity

With preview mode, you can now test how the form behaves in a process context without having to publish a new version. What does the form look like when you start the process? Who can view the role of “Supervisor”? Get the answer to these and other questions by logging on in any role and pulling up the form. This also ensures you always have a clear overview of the final form design and the functionality of your configuration!

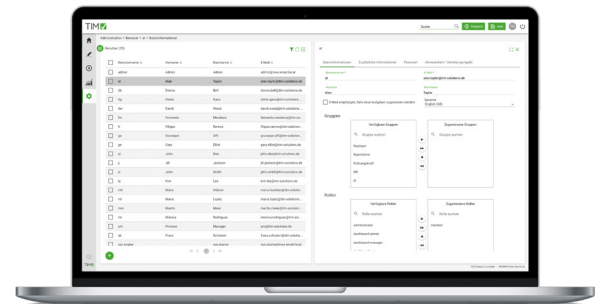

#5 TIM connectors for a greater number of options

Our new connectors make connecting web services a breeze, using approaches like REST. With TIM, you can easily integrate the external data sources of existing systems right into your workflows, enabling functions such as the automatic population of drop-down menus in in-process forms. Use TIM connectors to easily connect selection fields and test your connection directly in preview mode.

#6 Administrative interface for a greater overview

Effective immediately, administrators can now enjoy our new TIM interfaces as well. All features boast the TIM design and essential usability optimizations have made work easier. For example, users can now be cloned and activated through an activation link. A WYSIWYG principle applies here as well, meaning you have access to a full-scale overview of all changes and modifications. See for yourself!

We would be happy to advise you!

Digital processes are essential for companies, especially in these turbulent times. Start laying the right groundwork now to ensure you remain competitive into the future! With TIM you have an established and reliable partner at your side. Together, we make your company crisis-proof and get the ball rolling on your digitalization projects!
